

SWE201 : Cross Platform Development

Computing Technologies Department

<Practical 3>

<Submitted by>

Group No: 5

Programme: Software Engineering

Royal University of Bhutan, College of Science and Technology

1. Aim

This project is a student profile management app that helps users add, view, update, and delete student details easily. It provides a simple way to organize student information in one place and keep it updated.

2. Objective

By the end of this practical, the learner will be able to:

- Build a student profile management app in React Native.
- Display a list of student records using a scrollable card-based UI.
- Add new student details through a form modal.
- Update and delete existing student profiles.
- Fetch and show student data from an API or backend service.
- Use React Native hooks and components to manage app state and user interactions.
- Handle loading, refreshing, and error states in a simple mobile app.

3. Learning Outcomes

After completing this practical, the learner should be able to:

- Build a student profile management app using React Native.
- Display student records in a clean and scrollable list interface.
- Add, update, view, and delete student details through forms and modals.
- Handle API data, loading states, refresh actions, and error messages properly.
- Write organized and reusable React Native code using components and hooks.

4. Requirements

Software Requirements

- Node.js (latest stable version)
- npm
- Expo Go app on a physical Android/iOS device, or an emulator if available

- Code editor such as Visual Studio Code
- Existing Expo project from Practical 1 (optional but recommended) or a new Expo project created for this practical

Hardware Requirements

- A computer with internet access
- A smartphone for testing with Expo Go (recommended)
- Optional: Android/iOS emulator configured on the computer

5. Output (explanation)

- [Link](#)

6. Conclusion

Learning the code helped me understand how the app is structured and how different parts work together to create a complete mobile experience. It made concepts like navigation, state management, API communication, and Flexbox layout much clearer in practice. By studying the code line by line, I was able to see how small components combine to build a functional app, and that improved both my confidence and my problem-solving skills when working with React Native and Expo.
